

Should see two apps, the old app icon and new.
Unfortunately, this needs to be done before the new app has been synced with the server. User will need to delete the new version to restore presentations. However, they can expedite download and will explain below.

The Test.plist, at minimum, needs to be saved to the computer. This is a file that contains the different presentations. The file name could be better, it was a file we had created and planned to change, but a build released before we had the chance and we've kept it for compatibility. Select this file, then scroll down in iTunes and hit "Save To". Select a place on the local computer to save the Plist (we suggest My Documents/Desktop, etc). All of the files in this directory can be selected and saved using control/command + click, and then added to the new version, to save time redownloading content from server.

We now do the reverse of what we did above, and select the new 3.0 version app icon, and then hit the "Add..." button after scrolling down. Select the Plist, add it to the application and allow iTunes to sync (a progress bar should appear in the top center display window).

When this is done, open the CI media app, sync per normal, and the saved presentations should appear.
